Textarea Tag

The input tag, a tag we saw earlier in this domain, allows for a single line of text to be entered in a form. A textarea tag allows for multiple lines of text to be typed into a text box. It is often used to allow people to fill out a comment form, for example.
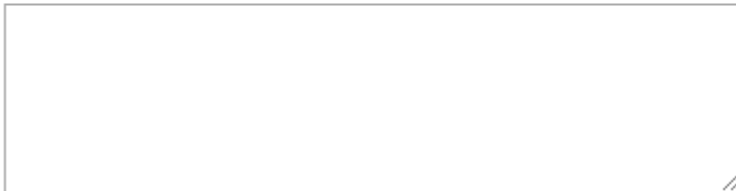

Purpose

Upon completing this project, you will be able to add a textarea tag to an HTML document.

Steps for Completion

1. Open the **34g-contactus.html** file in the MusicStore3 student folder.

2. Below the existing select tag, add a paragraph tag with the text, **Add comments below**

3. On the next line, add a textarea tag.

4. To the textarea tag, add attributes to make the text box **6** rows tall and **50** columns wide, with a **255** character maximum input.

5. Save your changes.

6. Preview the webpage in a browser. You should see this text area within the webpage:
